Activity 7: Understanding Life through the Lens of Religion and Science: A REFLECTION

The fact that science and religion have different worldviews is frequently brought up by those who claim that they are incompatible. Science is based on observation and data from experience, whereas religion is based on faith and revelation. As an example, a lot of religious people think that God created the universe, but scientists think that natural selection played a role in the universe's creation. Religious beliefs have driven the search for a natural explanation of the universe. For example, the desire to fully understand God's creation has motivated many scientists. Science is interested in comprehending the natural world; religion is concerned with issues of morality, meaning, and purpose. There are occasions when science and religion disagree, but there are other situations in which they can get along and even learn from one another. In the end, how well both fields of study interact will depend on how eager people are to have professional, open discussions with one another. Future developments in the relationship between religion and science are probably in store. There will inevitably be new challenges to religious beliefs as scientific knowledge expands. It's also achievable, though, that religion and science will discover new means of getting along or even working together. In the end, decisions made by people and communities will determine how religion and science interact in the future.
