Is Face-to-Face better than Online Classes?

Our planet, as we all know, is in trouble. We live in a time where normality appears to be non-existent. Stores are closed, people are sick, and education will be delivered entirely online for the remainder of the semester. My heart sank when I heard that students should not return to campus, instead, do their work online. MDSF has became my home, and I wanted nothing more than to finish my high school life the same way I had begun it in a classroom with all of my friends and that one teacher we all adored. Having said that, many students are not as connected online as they are in person. I agree that face-to-face learning provides students with immediate pleasure in terms of answers and assistance. This is when the teacher and the student meet in a specific location and time for one-on-one learning or, more often, group class sessions similar to what happens in school. Face-to-face learning is a very successful method of acquiring knowledge and skills since it frequently incorporates many modes of learning such as writing, reading, conversation, presentations, projects, group work, video clips, demonstrations, and practice.

When a student is in class, they might ask questions or seek assistance with a specific difficulty. If the student was at home, they would have to wait for the teacher to respond through email. Face-to-face learning, as opposed to computer-based education, provides a personal touch to a session. Other advantages of face-to-face learning are that you'll be able to concentrate harder on your learning because there'll be fewer distractions than if you were at home, and if you are online, there are so many distractions. The typical downsides of online learning revolve around technical issues. Nothing ruins an online class more than problems with audio, video, or connectivity. Excessive screen time can cause a variety of physical problems, such as bad posture and headaches. The internet is designed to divert students' attention away from studying content by providing social media and entertainment just a click away. The best online learning platforms and software available include a variety of tools and features to assist students in being attentive and interested. Let us be

honest, none of us can sit through an hour of class without becoming distracted or exhausted. Sometimes you need to close your eyes, yawn, or gaze out the window. What is the point of sitting in front of a computer for an extended amount of time, with just brief intervals, for half of the day? The majority of students will remain silent for the majority of the lesson and will still have to go over all of the content on their own.

Yes, it is true that the world is evolving where we must update our learning techniques amidst pandemic and embrace fresh approaches and be open to novel ideas but I do not think this is for everyone. This approach only favors the privileged people who are capable of keeping themselves focused on every subject because they have nothing else to do except study. I want to point out that while both forms of education have their own advantages and disadvantages, face-to-face education is more trustworthy and superior. Learning in groups and face-to-face helps students to broaden their horizons. It allows them to build a rapport with the instructor and boost their confidence. Looking into the camera for hours without our minds being focused on because of the different distractions at home results in practically nothing and is not a viable approach.
