I. Introduction

As the current pandemic situation still occurs to this day, it is significant that humans must not forget about taking care of the environment despite the difficulty and hardships that the majority of people are experiencing. This can be done by reducing its waste and having sufficient awareness of other things that contribute to the environmental problem. According to the University of Colorado Boulder, based on a study done by USA Today, the average American adult spends $1,497 a month on nonessential items. In this study, it confirms that if netizens from other countries have the habit of wasting their money on unnecessary items, this can be also applied to the other people from different countries as well due to the reason "this adds up extremely quickly and there are about 230 million tons of municipal garbage produced each year. " This is evidence that if humans do not have enough knowledge about how to conserve their materials and resources, it will lead to millions of garbage that will be produced even in the future generations.

There are a manageable number of ways on how to prevent and to lessen the waste. This is composting, utilizing reusable products, and recycling. The GreenWorks team named this "C.U.R.E." because this will help cure the wounds of the environment.

Despite the pandemic that millions of people are facing, the activities that GreenWorks company implemented are manageable and every person of all ages could easily handle the plans. Furthermore, the team also conducted an experiment on how people can manage to do these if the covid-19 and other mutated viruses are relevant today. GreenWorks came to the conclusion that all the content, news, updates, and incoming plans regarding the proposal will be posted in the facebook page that the company created real time. In this method, people do not need to go out to execute these action plans because the team is confident that these can be done inside the house or even in their backyard.

Additionally, humans already used minerals but not to such an extent that they will be used in everyday life. In the present era, the majority of people heavily relied on minerals and other natural resources without knowing the actual effects and consequences. The industrial world consumes millions of minerals without replacing and conserving them, hence, the present and mostly the future generations will suffer because nature takes hundreds of years to millions of years to produce mineral deposits.

The company also added an additional plan regarding the mineral resources because this plays a vital role in daily lives of people, moreover, almost all the objects, infrastructure, materials that surrounds humans are made up of minerals. In this sense, it is the responsibility of people to gather adequate knowledge regarding the minerals surrounding them. Spreading an informative brochure of its importance and why people should value its existence will give awareness to put emphasis on minerals resources. To save paper, and to prevent paper pollution, the brochure will be posted online, or each family can only have 1-2 brochures.

II. Purpose

The misbehavior of humans causes major changes, and people were already experiencing the unpleasant effects through the community they live in, as a result, the team wants to convey knowledge and alertness regarding waste that harm the environment and other living things, to give awareness how crucial practicing the use of natural resources and materials is, to have better insights about how to significantly minimize waste, to obtain the understanding concerning the importance of minerals in our daily lives, and to support the community by offering realistic activities that would result in a healthy and green environment.

The purpose of this project is not only about giving a better environment, but also to make the people stay inside their homes to prevent the increasing number of covid cases in the country, and while being at home, the project aims to provide information and more knowledge about minerals resources and to motivate the people of the community to read through the brochure that the company created. This will teach them reading comprehension, and also to have an active body by doing the “C.U.R.E” activities because this can also serve as their exercise.

III. Project Description

The project plans to educate people on how to properly use minerals and to properly dispose of the wastes. It will also share knowledge on how to keep the environment healthy.

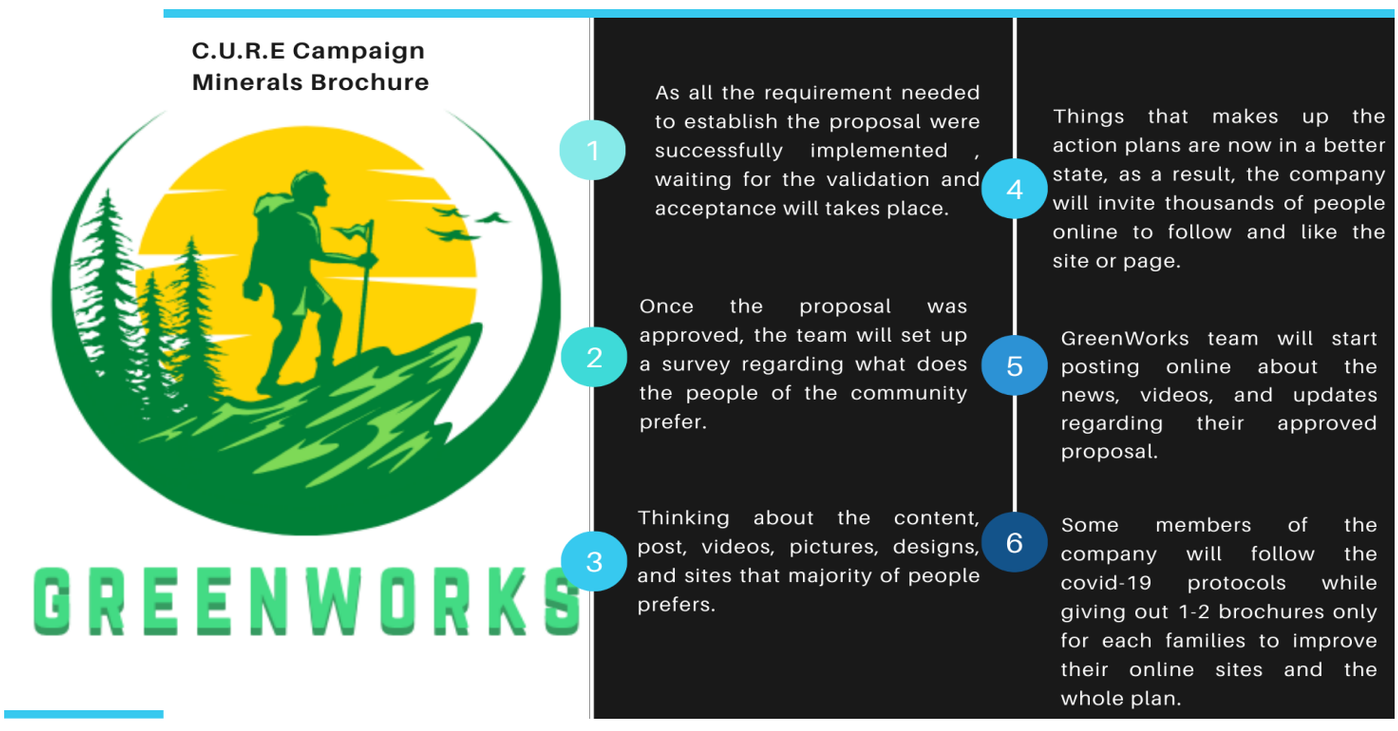

A. Goals and Objectives/Research Questions

With the increase in population, mineral consumption and waste have been steadily increasing. People without knowledge inappropriately use minerals and help with the increase in pollution. The goal of the project is to give awareness on how to properly use minerals, this will also teach people how to minimize waste by applying the appropriate activities such as recycling, utilizing reusable products, and composting or "C.U.R.E." As the group practices green methods, the project will help keep the environment green and clean and shape the minds of the younger generation. The group's objectives are the following:

- To give awareness about mineral consumption
- Conservation of mineral resources
- To teach proper waste management

B. Methodology and Timelines

The company is expecting to have its schedule based on the timeline below to implement the plans for each week. However, due to the pandemic, it might be that the schedule will be moved to another day or week. Despite the changes, the team will still follow the consecutive schedule even when the dates or weeks are different from the expected time. GreenWorks will continue to work on the action plans for the minimum of 3 months and maximum of 6 months due to the reason that better results at the end of the project gives motivation to pursue the plan. Seeing the environment getting better from the implementation of the proposal gives hope for the company to persistently offer its best services to humankind.

C. Benefits/Anticipated Outcomes

The company will give brochures, and in this way, people will be motivated to join in. The anticipated outcome is that many people will participate in this project proposal. A brochure will be given to them via online or in person, in this way, motivation will come to them and realize how important the proposal is for them and to the environment as well. The crew will ensure that all of the action plans will be carried out appropriately by being active and having desirable characteristics that could strengthen the project. The company also expects to achieve a greener and healthy environment, and also to shape the minds of the people to have a more detailed understanding of waste, and topics under the minerals. This will be also beneficial to the health of the majority of people around the society, because this can serve as their daily exercise that could help their own body. This will open their minds that helping reduce the waste and having adequate background information about minerals would result in a better place that they have always dreamt of. To wake up the consciousness of every person to start doing the "C.U.R.E" campaign, a project proposal like this would be beneficial to society and nature as it gives a good reason to begin an action and not just by words.

IV. Support Needed & Costs

For this to be successfully implemented, the members of the group are requesting the people to have genuine cooperation to have a unity environment. The people of the community must have technology that will enable them to be aware of the upcoming news and videos about the following topics in the project on facebook page.

Materials Needed ***If none of this is available, people can use something they already have.***
Composting
• Branches, flowers, leaves (Yard Debris)
• Vegetable waste (Food Waste)
• Egg Shells
• Water
Recycling
• Glass bottles / Jars
• Cardboard Boxes
• Plastic bottles
• Cans
Utilizing Reusable Products
• Plastic containers
• Plastic bags
• Magazines
• Glass Jars
• Cloths

V. Contact Information

The members of GreenWorks company who came up with the idea to execute the project "C.U.R.E" and brochure campaign. These are the people whose first goal in mind is to reduce the waste in the environment and to share knowledge and awareness about minerals resources to their fellow people of the community.
