What is your Invention? what does it do?

As we all know, charcoal is an excellent fuel, but it does affect our environment by cutting down so many logs of trees. We all know that dry leaves go to waste or drainage which affects our environment, and we did not seem to care. We invented alternative charcoal using dry leaves, which can lessen of using logs from trees that could have potential benefits, especially in terms of utilizing a readily available and renewable resource.

Yes, dried leaves can be used as charcoal fuel. In fact, they are a good source of renewable energy and can help to reduce deforestation. These are a sustainable and affordable way to cook, and they are also less smoky than traditional fuels, which can help to reduce indoor air pollution.

How is your invention similar to or different from existing tools or technologies in terms of function?

Charcoal made with leaves is different from existing tools in terms of ingredients because our charcoal is easy to make, and easier to find. It is also a product that is eco-friendly to the environment plus the cost material is budget friendly.

Charcoal made with leaves is a more sustainable and less smoky fuel than wood or coal. It is also comparable to natural gas and electricity in terms of heat output. However, it is important to note that the environmental impact of charcoal made with leaves will also depend on how the leaves are collected and processed.

Why is there a need for this invention? How will this invention make the world a better place to live in?

There is a need for this invention because as we know charcoal comes from trees that were burnt. So, by doing this project it will prevent trees from being cut down because it will only need dried leaves to create this product. It will be eco-friendly and budget friendly. Because every kilo of coal is very expensive now a days.

As we said it can make a better place because it will be more economic friendly so cutting trees will be lessen and with this product, we can create cleaning program by cleaning the streets and collecting the fallen dried leaves so both will benefit the streets will be cleaner then you will have the materials to create the product. Charcoal made with leaves is a versatile and sustainable fuel that can be used for a variety of purposes. It is a good alternative to other types of fuel, especially in areas where deforestation is a problem.
