Based on the video, answer the following questions using at least 3 sentences. Use the given rubric as your guide.

1. How does the video define/describe "software architecture" versus "software design"?

   Software architecture refers to the overall structure of a software system. It involves identifying the business requirements for the project and understanding how the different components of the software interact with each other. In contrast, software design focuses on the detailed planning and implementation of individual components. It outlines how specific features and functionalities will be developed within the software.

2. Explain how your project's software architecture guides your design decisions.

   In our project, Vendwise, we have decided to adopt a mobile-based approach for our core structure. We will utilize Flutter for our frontend development, Spring Boot for our backend, and SQLite for our database. This decision will shape the overall architecture of our system and define how each component interacts with the others. By establishing a solid software architecture for our application, we can enhance the efficiency of its processes. Given our focus on a mobile-based approach, we can also take advantage of the accessibility features that mobile applications offer.
