Module 4: Unit 3 and 5 Journal

Unit 3

1.

Trojan Horse - A Trojan horse is a type of malware that disguises itself as legitimate software. Once installed on a computer, a Trojan horse can perform a variety of malicious Trojan horses are often spread through phishing emails or malicious websites. When a user clicks on a malicious link or opens an infected attachment, the Trojan horse is installed on their computer without their knowledge. actions, such as stealing data, installing other malware, or disrupting system operations. there are some signs that may indicate that a computer is infected with a Trojan horse, like Slow computer performance, unexpected pop-up ads, Frequent crashes, or freezes, Disappearing files, Changes to your system settings.

Adware - Adware is unwanted software that displays advertisements on the user's computer. Adware can be bundled with other software, downloaded from malicious websites, or installed through drive-by downloads. Adware is not as dangerous as some other types of malwares, but it can be annoying and intrusive. Adware can also slow down your computer and make it difficult to browse the web.

Spyware - Spyware is software that collects information about the user's computer activity without their knowledge or consent. Spyware can track the user's browsing history, keystrokes, and passwords. It can also steal personal information, such as credit card numbers and social security numbers. Spyware is often spread through malicious websites or phishing emails. When a user clicks on a malicious link or opens an infected attachment, the spyware is installed on their computer without their knowledge. However, there are some signs that may indicate that a computer is infected with spyware, such as, Slow computer performance, unexpected pop-up ads, Frequent crashes or freezes, Changes to your browser settings, Disappearing files, Unexplained internet activity.

2. Keep your software up to date, use a firewall and Anti-virus software, be careful on links and attachments you open, Download software from trusted sources only. Be cautious about what you share online, use strong passwords, and always use HTTPS.

Unit 5

1. These taps, Tap-and-hold, swiping, pinch-and-stretch, and sliding are gesture typically used on a mobile device. Modern mobile devices use capacitive touchscreens. These capacitive displays support multitouch, meaning that gestures can be interpreted as events and responded to by software in a particular way.

2. Speech recognition is another important interface for controlling a mobile device. Speech recognition is one part of allowing hands free use of a mobile device. Using a Bluetooth or wired headset also means that the device can be kept in a pocket (while walking for instance) or used in a motor vehicle safely. Therefore, it can control a device that is connected via Bluetooth and by commanding the device using the user's voice.

3. Password locks, screen locks and full device encryption. The encryption key is derived from the PIN or password. A simple passcode requires the user to enter a PIN. Some devices can use biometric authentication via a fingerprint reader.

4. Airplane mode disables all wireless features (cellular data, Wi-Fi, GPS, and Bluetooth). Most airlines prevent flyers from using radio-based devices while onboard a plane.

5. Mobile device synchronization refers to copying data back and forth between a PC and phone or tablet. This method can be used to share email, calendar, and contacts with a locally installed mail application. It can be used to share media files between devices—camera pictures, downloaded music tracks or videos, and so on
