CS-302

INSTRUCTIONS:

Answer the following questions concisely and supported with details, using at least 5 sentences. Use the given rubric as your guide. Each answer is worth 5 points.

1. **Provide your own real-life experience that illustrates the concept of the statement: 'Software doesn't wear out.' Explain how the scenario demonstrated this principle.**

   I enjoy listening to music, which is why I always use Spotify. I have spent countless hours listening to my favorite Korean and Japanese songs. Even though it has been years since I started using this app, it still provides excellent service. Even though my old phone's hardware degrades, this app continues to deliver the same service. This shows that software doesn’t wear out, even if the hardware it runs on fails.

2. **Among the three criteria of a good software product (operational, transitional, and maintenance), which do you think is the most important for a developer/engineer to consider? Explain why.**

   The operational criteria of a good software product are the most important for a developer or engineer to consider because the operational aspects of the software determine whether the other two criteria remain relevant. A good software product must fulfill its purpose and operate reliably. Users care about its functionality more than the other two criteria. Without a solid system structure, it will eventually fail or crash, especially if the user wants to transfer the product to another system. They are part of the final system. They are distributed to customers as part of a project or product *(Operational software, n.d.)*. A successful software passes the operational criteria and is loved by the user.
