Mendoza, Gerail C.

ICT – 101

Module 1 Unit 5: Journal

1. Following the identification of the issue, the following steps are taken: conducting knowledge base or internet research, as necessary; developing a theory of probable cause; testing that theory to ascertain the cause; developing a plan of action to address the issue; implementing the solution; escalating the issue as needed; confirming the full functionality of the system; and, if appropriate, implementing preventive measures. The final step is documenting the findings/lessons learned, action, and outcome.

2. Implementing the solution.

3. Examine the component for physical damage. Look for wear in cables and connectors and dirt. Examine the computer case's ports for scrapes and harm. Check the fuse and power cable. If there is no damage contact technical support for more details, they can address the issue and come up with a helpful solution.

4. There may be a problem with either the hardware or the software if a computer crashes while it is running and ceases responding to mouse, or keyboard clicks. Although diagnosing these problems can be challenging, make sure the machine isn't getting too warm. A computer that is overheating may lock up or freeze because its parts may become too hot to work correctly.

5. The software or gadget that's giving you problems accompanied by (with its version number, which can typically be located by selecting Help > About. model and serial number, or a command).

6. The technical community groups, there are also a lot of community forums containing reviews, advice, support, and conversations regarding laptops or phones. If you use a search engine on the Internet to look for the signs of the issue you're experiencing, the outcomes will undoubtedly contain posts made in forums like this.

7. A search engine is a resource for finding web pages. A search engine could be made to search the whole of the internet for pages or to find pages within a specific website or instead of utilizing

syntax, typically, you can access the search the Advanced Search page of the search describe requirements with a form.

8. Use the URL and keywords from the website in your search query. You can also use a search engine that is specifically designed for that website.
