CS-302 6IMSOFTENG

Based on the video, answer the following questions concisely and supported with details (using at least 5 sentences). Use the given rubric as your guide. Each answer is worth 5 points.

1.

    1. Compare and contrast the challenges faced by software engineers in the past versus those in the present.

       The challenges faced by past developers included a lack of automation and coding with punch cards, which limited their productivity. Software engineers of that era used machines that filled entire rooms. In contrast, modern software engineers struggle to keep up with the rapid growth of AI, or artificial intelligence. Many tech workers have been laid off by their companies to cut costs and replaced with automation. Since AI can now write its own code, it can solve problems from simple to complex. With the rise of AI, companies now prefer using automation tools instead of hiring junior developers.

    2. As a student from the School of Computing, how do you see your role in adapting to the evolving responsibilities and expectations of software engineers in today's industry?

       As a student from the School of Computing, I see my role as a continuous learner in adapting to the evolving responsibilities and expectations of software engineers in today's industry. I recognize that as AI continues to improve, it's important to learn how to collaborate with it on tasks. Using AI to write code for programs is now more efficient. However, it's also essential for programmers to know how to code themselves and not rely too heavily on AI. We need to find the right balance when collaborating with AI because I believe that even if the world replaces humans with AI technology, it still can’t match human ingenuity and creativity. Staying updated on the industry's evolving nature is crucial to remaining relevant.
