Answer the following questions concisely and supported with details (using at least 5 sentences). Use the given rubric as your guide. Each answer is worth 5 points.

1. After watching the video, summarize the major ethical concerns surrounding Artificial Intelligence (AI).

   The three main ethical concerns surrounding Artificial Intelligence (AI) are the potential misuse of AI, limited access to AI development, and AI's lack of shared human values. We must ensure that the AI we create benefits people and consider how this technology might have a negative impact on us. Because running AI requires high resources, big companies control our access to this data, restricting how AI will be used in the future. AI will perform tasks as instructed, but it is a machine that does not share our values and could take misguided actions. This raises ethical questions about the risks AI could pose to us.

2. Select one ethical concern discussed in the video and do one of the following:

   - Share a personal experience that relates to this issue.
     or
   - If you haven't encountered it personally, explain how you can avoid or address such ethical challenges when using or developing AI technologies.

   I haven't faced the ethical concerns discussed in the video. I will ensure that any AI I develop benefits or helps people. I plan to thoroughly research how this technology might be misused so I can prevent it. Since AI is advancing rapidly, it's difficult to predict all the ways good AI could be misused. That's why, as computer science students, it's our responsibility to help reduce or prevent misuse.
