Mendoza, Gerail C.

ICT – 101

Module 4 Unit 2(CompTIA) Journal

1. Ethernet switch. - It is a central hub that allows multiple devices to communicate with each other by forwarding data packets between them. They are typically used in both home and business networks, and they come in a variety of sizes and configurations to meet the needs of different environments.

2. Your home network and your internet service provider (ISP) are connected via a modem. It transforms your ISP's signals into a language that your devices can understand. Coaxial cables or phone lines are the two common ways that modems are connected. While A router is a device that shares your modem's internet connection with every device connected to your home network. Additionally, it enables inter-device communication on your network.

3. Digital Subscriber Line (DSL), Cable/Hybrid Fiber Coax (HFC), Fiber to the Curb (FTTC), Satellite and Cellular Radio

4. Wi-Fi 6 (IEEE 802.11ac), the most recent Wi-Fi standard, utilizes both the 2.4 GHz and 5 GHz frequency bands.

5. You must be aware of the SSID (Service Set Identifier), also known as the wireless network's name, in order to manually setup a wireless connection and for the wireless network's encryption method, such as WPA2-PSK, which is utilized for security.

6. Someone may intercept data on an open network. operating the network or by other computers linked to the network. Make sure the online store utilizes a secure connection (HTTPS)

7. The term "attenuation" refers to how a signal weakens as it travels farther. must move around. Different distance constraints are set via attenuation. forms of network media.
